CONTINUITY AND DIFFERENTIABILITY

Definition of Continuity

The continuity of a real function (f) on a subset of the real numbers is defined when the function exists at point c and is given as-

$$\lim_{x \rightarrow c} f(x) = f(c)$$

A real function (f) is said to be continuous if it is continuous at every point in the domain of f.

Consider a function f(x), and the function is said to be continuous at every point in [a, b] including the endpoints a and b.

Continuity of "f" at a means,

$$\lim_{x \rightarrow a} f(x) = f(a)$$

Continuity of "f" at b means,

$$\lim_{x \rightarrow b} f(x) = f(b)$$

Differentiability Formula

Assume that if f is a real function and c is a point in its domain. The derivative of f at c is defined by

The derivative of a function f at c is defined by-

$$\lim_{h \rightarrow 0} \frac{f(x+h) - f(c)}{h}$$

Theorem 1: Algebra of continuous functions:

If the two real functions, say f and g, are continuous at a real number c, then

- (i) $f + g$ is continuous at $x=c$.
- (ii) $f - g$ is continuous at $x=c$.
- (iii) $f \cdot g$ is continuous at $x=c$.
- (iv) f/g is continuous at $x=c$, (provided $g(c) \neq 0$).

Theorem 2: Suppose f and g are real-valued functions such that (f o g) is defined at c. If g is continuous at c and if f is continuous at g(c), then (f o g) is continuous at c.

Theorem 3: If a function f is differentiable at a point c , then it is also continuous at that point.

Theorem 4 (Chain Rule): Let f be a real-valued function which is a composite of two functions u and v ; i.e., $f = v \circ u$.

Suppose $t = u(x)$ and if both dt/dx and dv/dt exist, we have $df/dx = (dv/dt) \cdot (dt/dx)$

Theorem 5:

- (i) The derivative of e^x with respect to x is e^x ; i.e., $d/dx(e^x) = e^x$.
- (ii) The derivative of $\log x$ with respect to x is $1/x$.
i.e., $d/dx(\log x) = 1/x$.

Theorem 6 (Rolle's Theorem): Let $f : [a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and differentiable on (a, b) , such that $f(a) = f(b)$, where a and b are some real numbers. Then there exists some c in (a, b) such that $f'(c) = 0$.

Solved Examples

Example 1: Let $[.]$ denotes the greatest integer function and $f(x) = [\tan^2 x]$, then does the limit exist or is the function differentiable or continuous at 0?

Solution: Given $f(x) = [\tan^2 x]$

Now, $-45^\circ < x < 45^\circ$

$\tan(-45^\circ) < \tan x < \tan 45^\circ$

$-\tan 45^\circ < \tan x < \tan 45^\circ$

$-1 < \tan x < 1$

So, $0 < \tan^2 x < 1$

$[\tan^2 x] = 0$

So, $f(x)$ is zero for all values of x from $x = -45^\circ$ to 45° .

Hence, f is continuous at $x = 0$ and f is also differentiable at 0 and has a value zero.

Example 2: A function is defined as follows:

$f(x) = x^3, x^2 < 1$

$x, x^2 \geq 1$

Discuss the differentiability of the function at $x=1$.

Solution: We have R.H.D. = $Rf'(1)$

$= \lim_{h \rightarrow 0} (f(1-h) - f(1))/h$

$= \lim_{h \rightarrow 0} (1+h-1)/h = 1$

and L.H.D. = $Lf'(1) = \lim_{h \rightarrow 0} (f(1-h) - f(1))/(-h)$

$$= \lim_{h \rightarrow 0} ((1-h)^3 - 1)/(-h)$$

$$= \lim_{h \rightarrow 0} (3-3h+h^2) = 3$$

$\therefore Rf'(1) \neq Lf'(1) \Rightarrow f(x)$ is not differentiable at $x=1$.

Example 3: If $y = (\sin^{-1}x)^2 + k \sin^{-1}x$, show that $(1-x^2) (d^2 y)/dx^2 - x dy/dx = 2$

Solution: Here $y = (\sin^{-1}x)^2 + k \sin^{-1}x$.

Differentiating both sides with respect to x , we have

$$dy/dx = 2(\sin^{-1} x)/\sqrt{(1-x^2)} + k/\sqrt{(1-x^2)}$$

$$\Rightarrow (1-x^2) (dy/dx)^2 = 4y + k^2$$

Differentiating this with respect to x , we get

$$(1-x^2) 2 dy/dx \cdot (d^2 y)/(dx^2) - 2x (dy/dx)^2 = 4(dy/dx)$$

$$\Rightarrow (1-x^2) (d^2 y)/dx^2 - x dy/dx = 2$$
